E-Voting Verifier using Hash Chain |Git Hub — Sep 2025

- Developed a simulated E-Voting Verifier web application using HTML, CSS, and JavaScript to demonstrate the principles of secure electronic voting and detect data tampering.
- Implemented a Hash Chain Logic where each vote record links to the previous vote's hash (NewHash = Hash(Voter ID + Vote + PrevHash)), ensuring that any modification immediately breaks the chain and verifies vote integrity.
- Designed UI with Tamper Simulation that provides visual feedback (e.g., status alerts and red highlights) to instantly indicate verification failures and tampering detection..
